

## Section 18 Continuous Functions.

Let  $X$  and  $Y$  be topological spaces. A function  $f : X \rightarrow Y$  is said to be **continuous** if for each open set  $V$  in  $Y$ , the set  $f^{-1}(V)$  is open in  $X$ .

Note that continuity depends on the function  $f$ , the spaces  $X$  and  $Y$  as well as the topologies defined on  $X$  and  $Y$ .

Fact:

It suffices to check continuity on a basis or sub-basis of a topology.

The  $\varepsilon$ - $\delta$  definition for continuity is equivalent to our definition.

The  $\varepsilon$ - $\delta$  definition and convergent sequence definition for continuity do not generalize to general spaces.

**Theorem 18.1:** Let  $X$  and  $Y$  be topological spaces; let  $f : X \rightarrow Y$  TFAE

(1)  $f$  is continuous

(2) For every subset  $A$  of  $X$  we have  $f(\overline{A}) \subset \overline{f(A)}$

(3) For every closed set  $B$  of  $Y$  the set  $f^{-1}(B)$  is closed in  $X$ .

(4) For each  $x \in X$  and each neighborhood  $V$  of  $f(x)$ , there is a neighborhood  $U$  of  $x$  so that  $f(U) \subset V$

Proof: Show  $(1) \Rightarrow (2) \Rightarrow (3) \Rightarrow (1)$  and  $(1) \Rightarrow (4) \Rightarrow (1)$

We say  **$f$  is continuous at a point  $x$**  if property (4) holds at  $x$ .

## Homeomorphisms

The function  $f : X \rightarrow Y$  is called a **homeomorphism** if  $f$  is bijective and if both  $f$  and its inverse are continuous.

A homeomorphism gives us a bijective correspondence between  $X$  and  $Y$  as well as between the collections of open sets. I.e. there is a correspondence between their topologies as well.

**A topological property of  $X$**  is a property expressed in terms of the topology of  $X$  (i.e. in terms of the open sets).

A homeomorphism will preserve topological properties.

The map  $f : X \rightarrow Y$  is called a **(topological) imbedding** of  $X$  into  $Y$  if  $f$  is an injective continuous map and if the restriction  $f : X \rightarrow f(X) \subset Y$  is a homeomorphism.

### Constructing Continuous Functions

**Theorem 18.2** Let  $X$ ,  $Y$ , and  $Z$  be topological spaces.

- (1) The constant function is continuous.
- (2) The inclusion map is continuous.
- (3) The composition of two continuous maps is continuous.
- (4) If  $f$  is continuous on  $X$  then it will also be continuous when restricted to a subset of  $X$ .
- (5) If the range can be expanded or restricted then those functions will be continuous.

#### **Theorem 18.3 – The Pasting Lemma**

Let  $X = A \cup B$ , where  $A$  and  $B$  are closed in  $X$ . Let  $f : A \rightarrow Y$  and  $g : B \rightarrow Y$  be continuous. If  $f(x) = g(x)$  for every  $x \in A \cap B$  then  $f$  and  $g$  combine to give a continuous function  $h : X \rightarrow Y$  defined by setting  $h(x) = f(x)$  when  $x \in A$  and  $h(x) = g(x)$  when  $x \in B$ .

#### **Theorem 18.4 – Maps into Products**

Let  $f : A \rightarrow X \times Y$  be given by the equation  $f(a) = (f_1(a), f_2(a))$ . Then  $f$  is continuous if and only if the coordinate functions  $f_1 : A \rightarrow X$  and  $f_2 : A \rightarrow Y$  are continuous.
