- Humans are converted to zombies at a rate proportional to the number of encounters.
- In the absence of zombies the human population grows exponentially.
- In the absence of humans the zombie population decays exponentially.

A Predator-Prey Model:

A Mathematical Glance at Zombie Infestation

Brody Dylan
Johnson

Introduction

A Simple
Mathematical
Model

A Reality
Check

Zombie
Infestation
with
Resistance

Simulations

Conclusion

The above assumptions lead to the standard predator prey model:

$$\frac{dH}{dt} = a_1 H - a_2 H \cdot Z$$

$$\frac{dZ}{dt} = -a_3 Z + a_4 H \cdot Z,$$

where $a_1, a_2, a_3, a_4 > 0$.

This is equivalent to

$$\frac{dH}{dt} = a_2 H(r_1 - Z)$$

$$\frac{dZ}{dt} = a_4 Z(H - r_2),$$

where $r_1 = \frac{a_1}{a_2}$ and $r_2 = \frac{a_3}{a_4}$.

The system has equilibria at $(H, Z) = (0, 0)$ and $(H, Z) = (r_2, r_1)$.

Resistance

Simulations

Conclusion

- The Jacobian (matrix of partial derivatives) is given by

$$J(H, M, Z) = \begin{bmatrix} -a_1 Z & 0 & -a_1 H \\ 0 & -a_2 Z & -a_2 M \\ a_3 Z & -a_4 Z & a_3 H - a_4 M \end{bmatrix}.$$

- The eigenvalues of $J(H, M, Z)$ at an equilibrium point determine the nature of the equilibrium.

Classifying the Equilibria:

- The Jacobian (matrix of partial derivatives) is given by

$$J(H, M, Z) = \begin{bmatrix} -a_1 Z & 0 & -a_1 H \\ 0 & -a_2 Z & -a_2 M \\ a_3 Z & -a_4 Z & a_3 H - a_4 M \end{bmatrix}.$$

- The eigenvalues of $J(H, M, Z)$ at an equilibrium point determine the nature of the equilibrium.
 - Doomsday equilibrium $(0, 0, Z_0)$: $\lambda_1 = 0$, $\lambda_2 = -a_1 Z_0$, $\lambda_3 = -a_2 Z_0$.

Classifying the Equilibria:

- The Jacobian (matrix of partial derivatives) is given by

$$J(H, M, Z) = \begin{bmatrix} -a_1 Z & 0 & -a_1 H \\ 0 & -a_2 Z & -a_2 M \\ a_3 Z & -a_4 Z & a_3 H - a_4 M \end{bmatrix}.$$

- The eigenvalues of $J(H, M, Z)$ at an equilibrium point determine the nature of the equilibrium.
 - Doomsday equilibrium $(0, 0, Z_0)$: $\lambda_1 = 0$, $\lambda_2 = -a_1 Z_0$, $\lambda_3 = -a_2 Z_0$.
 - Eradication equilibrium $(H_0, M_0, 0)$: $\lambda_1 = 0$, $\lambda_2 = 0$, & $\lambda_3 = a_3 H - a_4 M$.

Classifying the Equilibria:

- The Jacobian (matrix of partial derivatives) is given by

$$J(H, M, Z) = \begin{bmatrix} -a_1 Z & 0 & -a_1 H \\ 0 & -a_2 Z & -a_2 M \\ a_3 Z & -a_4 Z & a_3 H - a_4 M \end{bmatrix}.$$

- The eigenvalues of $J(H, M, Z)$ at an equilibrium point determine the nature of the equilibrium.
 - Doomsday equilibrium $(0, 0, Z_0)$: $\lambda_1 = 0$, $\lambda_2 = -a_1 Z_0$, $\lambda_3 = -a_2 Z_0$.
 - Eradication equilibrium $(H_0, M_0, 0)$: $\lambda_1 = 0$, $\lambda_2 = 0$, & $\lambda_3 = a_3 H - a_4 M$.
- The most important quantity is $a_3 H - a_4 M$.
